

SI's new HD Screen materials maximize the 1080P projectors

Standard

BE LEERY! The image above illustrates most projection screens on the market today. The texture you see actually minimizes the projectors resolution making the picture soft. Essentially you are not receiving the benefits of the projector that you paid for.

The image above illustrates SI's new HD Embossed screen materials. You will notice very little texture with the human eye. SI has created the ultimate texture giving you the best resolution reproduction while delivering an extremely wide viewing angle.

“SI is proud to introduce our new HD optimized front projection screen surfaces. The new Solar HD, Gamma HD, and Lunar HD materials have been matte embossed with our finest pattern to date insuring that all HD projectors’ resolution is fully preserved through the reflective process and delivered to the viewer at the highest possible clarity.” said Tim Freemyer, CTO.
